

FROM INSTRUCTION TO RUNNING APPLICATION

# Describe the product. BuilderX creates the working app.

A Codex-powered application builder that turns a plain-language brief into a project-scoped team of agents, an isolated workspace, a live preview, and an exportable full-stack package.

Prompt driven

Project isolated

Live playground

Docker ready

ONE CONTROL SURFACE, COMPLETE DELIVERY PATH

## More than a page generator

BuilderX manages the work around generation too: project boundaries, specialist coordination, live execution, iteration, media context, existing-project import, and deployment handoff.

### 01 / INTERPRET

#### Turn a brief into a build plan

The orchestrator reads the instruction, identifies the product type and sections, and prepares a structured request.

### 02 / STAFF

#### Create project-specific agents

Each project receives a distinguishable orchestrator plus relevant UI, content, data, commerce, media, or packaging specialists.

### 03 / ISOLATE

#### Give every project its own home

Generated apps live as detachable sibling folders under the root workspace, with a dedicated runtime port and project identity.

### 04 / BUILD

#### Use the current Codex workflow

The Run workflow action sends the selected project's instruction and media context to Codex and reports progress in the runtime log.

### 05 / REVIEW

#### Preview and switch instantly

The project dropdown selects the active app; the Playground follows its assigned localhost address without mixing project state.

### 06 / DELIVER

#### Export a runnable full-stack package

Download source with frontend, backend, PostgreSQL service, environment configuration, Dockerfiles, and Compose orchestration.

A FIVE-STEP WORKFLOW

# From idea to preview without setup ceremony

The key interaction is intentionally simple: select a project, describe the change, and run. BuilderX handles where the code belongs, which runtime serves it, and which agents own the work.

## 1 prompt

Starts a complete project generation workflow.

## 1 live view

Keeps the selected project's output visible while you iterate.

## 1 export

Packages the source and supporting services for handoff.

## EVERYTHING STAYS IN CONTEXT

# Build, observe, and switch projects in one place

- 1 Project-aware Playground**  
The selected project controls the preview URL and port.
- 2 Instruction and workflow**  
Send a new build or a focused revision directly to Codex.
- 3 Media and project import**  
Add visual references or bring an existing application into the same managed workflow.
- 4 Visible runtime progress**  
See connection state, build progress, file changes, and runtime refresh events.
- 5 One-click export**  
Package the selected project instead of exporting an unrelated global build.

LEDGERIQ / FINANCE SAAS

# A confident homepage for an AI finance analyst

Generated from a concise brief requesting a premium SaaS homepage with a hero, KPI strip, workflow, pricing teaser, and polished call to action.

VISUAL DIRECTION

High-trust enterprise product

Dark analytical canvas, bright data accents, dense financial UI, and clear navigation.

PRODUCT STORYTELLING

Outcome first, evidence close behind

Strong headline paired with forecast confidence, variance review, and operational metrics.

IMPLEMENTATION RESULT

Responsive React + Vite app

Generated as its own named workspace with source that can be iterated independently.

#### MAPEX / LOCATION INTELLIGENCE

## A distinct product experience from the same workflow

Mapex demonstrates range: a location-based business research product with an expressive search-radius visual, clear data promise, and export-focused positioning.

#### VISUAL DIRECTION

### Editorial geospatial interface

Grid structure, radar rings, local markers, and a precise high-contrast action system.

#### PRODUCT STORYTELLING

### Every business within 100 km

The value proposition, coverage, captured fields, and CSV output are understandable immediately.

#### PROOF OF FLEXIBILITY

### Not a reused finance template

Brand language, information architecture, typography, and interaction cues adapt to the product domain.

HOW BUILDERX STAYS ORGANIZED

## Every app gets boundaries, ownership, and an explainable agent team

The orchestrator does not treat every instruction as the same job. It creates a project relationship model, assigns relevant specialists, and keeps that topology available to the D3/Neo4j system view.

### Named workspace

A detachable project folder under the root workspace.

### Exclusive port

A preview address that belongs only to that project.

### Selected context

Instructions and uploaded media target the active app.

#### PROJECT ORCHESTRATOR

## Reads the brief, forms the team, coordinates Codex

Relationships are stored as project ownership and delegation links, making each project's agent graph distinguishable.

UI composition

Content + data

Domain specialist

Runtime packaging

### Codex execution

Edits real files in the selected project workspace.

### Runtime events

Shows progress, changes, refresh, and completion.

### Graph visibility

D3 presents project-to-agent relationships for review.

THE GENERATED WORK REMAINS YOURS

# Preview in BuilderX. Export as an independent application.

### Exported application package

The selected app is packaged with the components needed for local development and containerized deployment.

|                    |                    |
|--------------------|--------------------|
| Frontend source    | Backend service    |
| package.json       | .env               |
| Dockerfiles        | docker-compose.yml |
| PostgreSQL service | Project assets     |

- + Independent by design**

Each project lives outside the BuilderX app folder and is added to the root gitignore, so it can be detached or moved when needed.
- + Safe to continue**

Source files, environment placeholders, dependency manifests, and container definitions support future development rather than a screenshot-only handoff.
- + Easy to revisit**

Import an existing zipped app, assign it a managed workspace and port, then use the same instruction-and-preview loop for enhancements.

THE PRACTICAL PROMISE

## Ideas become inspectable, editable, runnable software.

Agentic BuilderX compresses the distance between describing a product and having a real codebase in front of you, while preserving the project boundaries and deployment artifacts serious work needs.

## Prompt to app

with live preview, project-specific agents, isolated runtime, and full-stack export.
